Dr. Schwabe, and found the effects exactly the same with other remedies. However, also to attach some importance to the application of James's powder; and I have every reason to think that it would prove some degree of consciousness. There was great disinclination to swallow fluid; it required more than ordinary force to effect this object. After a considerable excitement, for a minute or two he would fall into a quiet state, scarcely moving; he would suddenly begin to throw about his arms, and strike them forcibly from him, and then seize the bed-clothes, and endeavour to draw them over his face and head. The arms occasionally twitched convulsively.

At the latter end of December (the 20th,) I was requested to see Master N., in consequence of the obstinacy of the jaundice, and considered it necessary to prescribe an ounce of extract of dandelion, to which was added two wine-glassfuls of water. Of this mixture he was ordered to take three tea-spoonfuls three times a day, and did so regularly until the 4th of January, when the pot which contained the extract was again sent to the druggist to be re-filled, and at night the water added as usual. For some reason unassigned, the night dose was not administered.

At eleven, a.m., of the 5th, the first dose of the mixture or fluid extract was given by the mother, at which time the boy was in good spirits, and in every respect much better; the secretion of bile was passing off, when he became quiet, though constantly affected with twitchings in the arms. Not knowing what to do, and ascribing the state to exhaustion for a few hours, having occasion to absent herself for some time, I remained with the patient for a considerable time; at which time the symptoms continued as before assigned a cause for the sudden change in the case, Dr. Duncan was equally at a loss with myself as to the cause of the symptoms; at first he was inclined to attribute them to the jaundice, or some intestinal irritation, but from the fact that the child had been so much better, and the bile beginning to pass into the bowel, at once did away with the first supposition. On questioning the mother (who had by this time returned home,) we for the first time learnt that fresh medicine had been procured on the previous night, and she did not at the time of mixing it think it quite the same as before. On examining the extract we immediately considered it a wrong medicine, and pronounced it either belladonna or henbane. To make ourselves fully satisfied we visited the druggist who had furnished it, as well as the former pots of extract. He unhesitatingly acknowledged that he had sent the extract of belladonna, and for the moment did not appear aware of.

CASE OF POISONING BY EXTRACT OF BELLADONNA.

By John M. Banner, Esq., F.R.C.S., Senior Surgeon to the Northern Hospital, Liverpool.

T. N., aged nine, was affected, on the 27th of October, 1846, with mild scarlatina. The fever ran its course in about eight days. On the third day after the disappearance of the eruption, jaundice presented itself; the skin was highly tinged, the stools white, and the urine highly impregnated with bile. Although the eruption disappeared, it was not until the 27th of December that the process of desquamation was completed.

At the latter end of December (the 20th,) I was requested to see Master N., in consequence of the obstinacy of the jaundice, and considered it necessary to prescribe an ounce of extract of dandelion, to which was added two wine-glassfuls of water. Of this mixture he was ordered to take three tea-spoonfuls three times a day, and did so regularly until the 4th of January, when the pot which contained the extract was again sent to the druggist to be re-filled, and at night the water added as usual. For some reason unassigned, the night dose was not administered.

At eleven, a.m., of the 5th, the first dose of the mixture or fluid extract was given by the mother, at which time the boy was in good spirits, and in every respect much better; the secretion of bile was passing off, when he became quiet, though constantly affected with twitchings in the arms. Not knowing what to do, and ascribing the state to exhaustion for a few hours, having occasion to absent herself for some time, I remained with the patient for a considerable time; at which time the symptoms continued as before assigned a cause for the sudden change in the case, Dr. Duncan was equally at a loss with myself as to the cause of the symptoms; at first he was inclined to attribute them to the jaundice, or some intestinal irritation, but from the fact that the child had been so much better, and the bile beginning to pass into the bowel, at once did away with the first supposition. On questioning the mother (who had by this time returned home,) we for the first time learnt that fresh medicine had been procured on the previous night, and she did not at the time of mixing it think it quite the same as before. On examining the extract we immediately considered it a wrong medicine, and pronounced it either belladonna or henbane. To make ourselves fully satisfied we visited the druggist who had furnished it, as well as the former pots of extract. He unhesitatingly acknowledged that he had sent the extract of belladonna, and for the moment did not appear aware of.

When I saw the case at three o'clock, I was told that the boy had vomited twice after taking the tea, and had thrown from the stomach a large quantity, which had not been preserved. The patient appeared in a comatose state; the breathing was slow; the eyes fixed; the pupils dilated to the fullest extent, and insensible to the admission of light; the hands and feet were cold and moist; the pulse was remarkably quick and weak, and slightly intermittent. If roused the patient tried to seize hold of the person touching him, and would shout, and occasionally laugh loudly, and would throw out the arms as if striking at an object; he could not articulate, though he often muttered as if attempting to express something; there was twitching of the flexor muscles of the arms, particularly of the left; he frequently seized hold of the bed-clothes, and attempted to draw them up, as if to cover his head. I ordered wine and hot water to be given freely; warmth to be applied to the surface, and cold-spirit wash to the head, and a large enema of salt and gruel was administered. After this injection the patient became very restless, constantly trying to get up. Thinking it probable that he wanted to pass stool, we carried him to the chair, when he passed large evacuations, which would prove some degree of consciousness. There was great disinclination to swallow fluid; it required more than ordinary force to effect this object. After a considerable excitement, for a minute or two he would fall into a quiet state, scarcely moving; he would suddenly begin to throw about his arms, and strike them forcibly from him, and then seize the bed-clothes, and endeavour to draw them over his face and head. The arms occasionally twitched convulsively. I remained with the patient for a considerable time; the first impression was that he had taken some narcotic poison, contained either in an embrocation or cough mixture. We carefully examined the room, but could not find anything confirmatory of this.

Having explained to the family the great danger the child appeared to be in, and the difficulty I felt in assigning a cause for the sudden change in the case, Dr. Duncan was requested to meet me in consultation. We met at five o'clock, five hours after the first attack, at which time the symptoms continued as before related, with the exception that the surface generally was warmer. The wine and water had been forced into the mouth, and he had swallowed a considerable quantity, on various occasions.

Dr. Duncan was equally at a loss with myself as to the cause of the symptoms; at first he was inclined to attribute them to the jaundice, or some intestinal irritation, but from the fact that the child had been so much better, and the bile beginning to pass into the bowel, at once did away with the first supposition. On questioning the mother (who had by this time returned home,) we for the first time learnt that fresh medicine had been procured on the previous night, and she did not at the time of mixing it think it quite the same as before. On examining the extract we immediately considered it a wrong medicine, and pronounced it either belladonna or henbane. To make ourselves fully satisfied we visited the druggist who had furnished it, as well as the former pots of extract. He unhesitatingly acknowledged that he had sent the extract of belladonna, and for the moment did not appear aware of.

the mistake. It appeared that he had to send out some of the extract of belladonna on the night in question, and the impression on his mind was, that the same extract was wanted for T. N., and thus the mistake arose. I mention this circumstance to prove that there is no mistake as to the extract of belladonna being given, nor of the quantity taken.

The mode of treatment was persevered in; the lotion to the head, the wine and water drink, and a powder containing rhubarb and calomel given, which acted freely. The evacuation was dark-coloured, and from the peculiar odour, we considered it to contain a considerable quantity of belladonna. The delirium continued during the night, little varying from the symptoms enumerated; the pulse became more intermittent and full, so that it was thought proper to discontinue the stimulants.

At four, a.m., of the 6th, sleep for the first time overcame the patient; he slept lightly for two hours, after which the delirium was less violent, the pulse more tranquil, though very intermittent. He again slept lightly until near nine, a.m., and appeared more conscious afterwards; the pupils were still fully dilated, and he did not appear to see objects clearly, for on taking his hand, he felt with the other hand at what touched him, and laughed very much; he had less disinclination to take fluid, and partook of a small quantity of gruel. During the whole delirium he showed, from his peculiar restlessness, that he either wished to pass water or stool, neither of which passed involuntarily. There was not the least appearance of eruption.

From this time the symptoms gradually disappeared, the pulse became more regular, the pupils gradually became less dilated, though very irregular in their action; it was not until the expiration of five days that they acted more regularly; at that time the right pupil remained more dilated than the left. He complained for several days of pain in the head and difficulty of vision; he could not see to read with ease for some time, indeed I may say, that it was ten days before he got from under the influence of the poison.

From the calculation made, we consider that at least thirty grains of the extract of belladonna was given. The belladonna did not appear to have any effect on the jaundice, beyond the fact of its deranging the system for several days.

CLINICAL REPORTS OF SURGICAL CASES UNDER THE TREATMENT OF WILLIAM SANDS COX, ESQ.

By Peter Hinckes Bird, one of the Resident Medical Officers. 

(Continued from page 69.)

CASE XXII.

SCROFULOUS CARIES OF THE SPINE.

James Riley, aged 25, labourer, admitted March 25th, 1846, into the Queen's Hospital, Birmingham, under the care of Mr. Sands Cox. He states that rather more than two years ago he first felt a pain in his right side, which afterwards flew to the back; it was treated as a rheumatic pain; he gradually got worse, and eighteen months ago he was obliged to give up his occupation, as he got very weak, and was soon tired; the use of his legs was gradually impaired, and his back became weak, and he perceived that the backbone became prominent. He states that his legs have at times been drawn up at nights; his urine dribbled away, and he had not perfect control over defecation; has never had abscesses in the back nor in any other part of the body; had swelling of the submaxillary glands a short time since. He states that he contracted syphilis two years ago, for the cure of which he took mercury; has been under medical treatment for eighteen months; enjoyed good health previously,—that is to say, about two years ago.

He complains of dull aching pain in the dorsal region, and of slight tightness across the chest; he cannot stand or walk upright, but is much bent forward; his legs feel numbed and cold, and the sensibility is diminished; can retain his water perfectly; urine rather turbid, of natural quantity; pulse strong, 86; appetite good; has a slight cough; the muscles of his limbs are soft, flabby, and atrophied; has no pain in the arms. On examination of the back there was found projection of the spinous processes of the middle dorsal vertebrae; there is no abscess there, nor on any part of the body.

Ordered to be cupped on each side of the spine, and to remain in bed in the recumbent posture.

April 3rd. About the same; legs still numbed; appetite indifferent; bowels rather confined.

6th. Better; bowels open; appetite improved.

20th. Much better; can walk in a more erect posture; appetite improved; cough quite gone; bowels regular; his urine presented this morning an iridescent pellicle; this he states he has noticed frequently before. On examination of a portion under the microscope, the beautiful prisms of the neutral phosphate, mixed with imperfectly-formed crystals of the neutral phosphate, and a few penniform crystals, with epithelium.

Contin. mist. tonica.

23rd. Bowels rather confined. To take Pil. Rhei Comp. ij., statim.

26th. Complains of pain in the back. To have an issue applied on each side of the diseased vertebrae.

29th. The sloughs have separated. To have the issue kept open by the daily insertion of peas.

May 6th. The issues have discharged freely; feels better; legs not so numbed; the pain has disappeared from the dorsal region, and occupies the lower part of the lumbar, extending from hip to hip; can walk much better.

14th. Can walk upright; pain in the hips not so severe; the urine, which was pale, and of a light amber colour, when examined under the microscope, presented
